

Our engineers first control the by logistics done hardware installation as delivery turnover. Than our engineers will support/assist (as consultants) the own IT staff of an organization in making the right (redundant) physical network connections. Than our engineers will support/assist (as consultants) the own IT staff of an organization in managing the new storage capacity (including snapshot backup settings). Than our engineers will support (as consultants) the own IT staff of an organization in connecting all these facets of configuration based on the GFS2 technology to the SAN ports of the SanIndus technology. Nothing changes: just mega storage is attached in (for the users and servers) redundant configuration.
