SanIndus has reduced power consumption to only 50 watt per hour per terabyte. Fighting global warming caused by harddisk power consumption is easy by SanIndus her technology. Furthermore SanIndus her technology enables the possibility for organizations to switch to new low energy harddisk free workstation/server configurations. Just replace harddisks by IDE connected solid state memory for some programs/services demand that still requires some local temp space. As prices of energy will double or triple in 2009 (due to rising coal prices), fighting the increasing energy bills and climate change caused by storage can be done simple by installing SanIndus her SAN technology within your organization.
