

SanIndus claims to improve SAN speeds beyond any current industry limit. Redundancy, volume and pricing are the three most easy to achieve target in the SAN industry worldwide. But speed always was contra dictionary to these three other demands. Improving speed was phase two target of our research and we did it. SanIndus offers the highest SAN speeds available in each default configuration and is capable of just adding unlimited more power (to maintain high speeds by excessive use) by adding just one or more SAN controlling servers into the cluster.
