

SanIndus has made an instant implemental SAN technology that can be implemented in just one day in any organization, regardless the size of organizations and technological environments (operating systems, directory services, file systems, protocols, applications, etc) used. Besides full redundancy this is a huge benefit of SanIndus. Long and expensive stages can be replaced by just choosing for the technology of SanIndus. Just have redundant power available and be able to connect the redundancy connections into your network. The technology of SanIndus just will provide all the needed gateway functionality between outside environments, the GFS2 cluster and the SAN technology. Gateway functionality to new platforms can be put in place within one minute because they are already available in the SAN technology, but only the present needed are active. No other SAN technology has such an intelligent instant extendable to new platforms SAN gateway technology.
